The number of LIVE dormice in a box is recorded. NB this may not be the best measure as it gives no indication of the population age structure and numbers are likely to be under-recorded as total number of YOUNG may not always be accurately noted

The count is standardised to the number of dormice recorded by month per 50 boxes i.e (50/no.of boxes checked) x no. of DORMICE recorded

The Spring count is the maximum of the May and Jun standardised count

The Autumn count is the maximum of the Sep and Oct standardised count

Total number of live dormice in Spring and Autumn recorded in UK regions compared to Briddlesford Reserve per 50 boxes
